Guide to the problem sheets

To *try* solving problems is the best (only?) way to learn the subject.

I will post four problem sheets, where some are quite demanding problems, as a way to get bonus for the written exam consisting of the *first question of the exam being discounted*. To receive this bonus one should either *participate* in three of the four problem sessions or write up and hand in solutions to a substantial part of the problems. By participating in the problem sessions, one should be prepared to either describe a solution or describe failed attempts to a substantial part of the problems. A substantial part could be approximately four per sheet.

I understand that the problems may be quite challenging and it is OK to ask for hints and help on how to start.

Best wishes,
Anders
