

6. The Fourier Transform (Ch. 8.3)

DEF: A character on a topological (abelian) group G is a continuous homomorphism $G \rightarrow \langle \{z \in \mathbb{C} : |z|=1\}, \cdot \rangle$.

We set \widehat{G} = [the dual of G] = the group of all characters on G .

Theorem (8.19): We have $\widehat{\mathbb{R}^n} \cong \mathbb{R}^n$; an isomorphism is given by $\vec{z} \mapsto \phi_{\vec{z}}, \mathbb{R}^n \rightarrow \widehat{\mathbb{R}^n}$, where $\phi_{\vec{z}}(x) = e^{2\pi i \vec{z} \cdot x}$

DEF: For $f \in L^1(\mathbb{R}^n)$, set

$$(\mathcal{F}f)(\vec{z}) = \widehat{f}(\vec{z}) = \int_{\mathbb{R}^n} f(x) e^{-2\pi i \vec{z} \cdot x} dx \quad (\vec{z} \in \mathbb{R}^n)$$

Note: $\mathcal{F}: L^1(\mathbb{R}^n) \rightarrow BC(\mathbb{R}^n), \|\widehat{f}\|_u \leq \|f\|_1$

Theorem 8.22. For all $f, g \in L^1(\mathbb{R}^n)$:

a) $(T_y f)^{\wedge}(\vec{z}) = e^{-2\pi i \vec{z} \cdot y} \cdot \widehat{f}(\vec{z})$ and $T_y(\widehat{f}) = \widehat{h}, h(x) = e^{2\pi i \vec{y} \cdot x} f(x)$.

b) $\forall T \in GL_n(\mathbb{R}): (f \circ T)^{\wedge} = |\det T|^{-1} \cdot \widehat{f} \circ (T^*)^{-1}$

Special cases: If T is a rotation then $(f \circ T)^{\wedge} = \widehat{f} \circ T$

If $T(x) \equiv t^{-1}x$ (some $t > 0$) then $(f \circ T)^{\wedge}(\vec{z}) = t^n \cdot \widehat{f}(t\vec{z})$.

c) $(f * g)^{\wedge} = \widehat{f} \widehat{g}$

d) If $x^\alpha f \in L^1$ for all α with $|\alpha| \leq k$, then $\widehat{f} \in C^k$ and $\partial^\alpha \widehat{f} = [(-2\pi i x)^\alpha f]^{\wedge}$.

e) If $f \in C^k$, $\partial^\alpha f \in L^1$ for $|\alpha| \leq k$ and $\partial^\alpha f \in C^0$ for $|\alpha| \leq k-1$
then $(\partial^\alpha f)^{\wedge}(\vec{z}) = (2\pi i \vec{z})^\alpha \cdot \widehat{f}(\vec{z})$.

f) $\mathcal{F}(L^1(\mathbb{R}^n)) \subset C_0(\mathbb{R}^n) \quad (\text{Riemann-Lebesgue})$

DEF (inverse Fourier transform)

$$\text{For } f \in L^1(\mathbb{R}^n), \quad \check{f}(x) = \widehat{f}(-x) = \int_{\mathbb{R}^n} f(z) e^{2\pi i z \cdot x} dz$$

We also write $\widetilde{f}(x) = f(-x)$. Then $\check{f} = \widetilde{\check{f}} = \widehat{\check{f}}$.

Fourier Inversion Theorem (8.26):

If $f \in L^1(\mathbb{R}^n)$ and $\widehat{f} \in L^1(\mathbb{R}^n)$ then $(\widehat{f})^\vee = (\check{f})^\wedge \in C_0(\mathbb{R}^n)$ and $(\widehat{f})^\vee = f$ a.e.

Lemma: If $f, g \in L^1(\mathbb{R}^n)$ then $f * \check{g} = (\widehat{f} \cdot g)^\vee$.

$$\text{proof: } f * \check{g}(x) = \int f(y) \check{g}(x-y) dy = \iint f(y) g(z) e^{2\pi i (x-y) \cdot z} dz dy.$$

$$(\widehat{f} \cdot g)^\vee(x) = \int \widehat{f}(z) g(z) e^{2\pi i x \cdot z} dz = \iint f(y) e^{-2\pi i y \cdot z} g(z) e^{2\pi i x \cdot z} dy dz.$$

Fubini \Rightarrow Equal!

3

Explicit approximate unit?

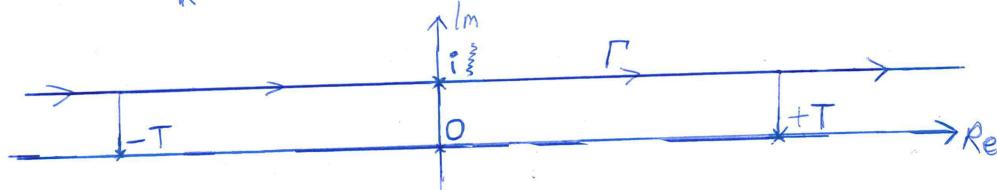

Prop 8.24: If $\phi(x) = e^{-\pi|x|^2}$ then $\widehat{\phi}(z) = e^{-\pi|z|^2}$.

$$\text{proof: } \widehat{\phi}(z) = \int_{\mathbb{R}^n} e^{-\pi|x|^2} e^{-2\pi i z \cdot x} dx = \prod_{j=1}^n \int_{\mathbb{R}} e^{-\pi x_j^2 - 2\pi i z_j x_j} dx_j$$

$$\boxed{\text{If Prop 8.24 holds for } n=1} \rightarrow = \prod_{j=1}^n e^{-\pi z_j^2} = e^{-\pi|z|^2}.$$

Remains verifying for $n=1$:

$$\widehat{\phi}(z) = \int_{\mathbb{R}} e^{-\pi x^2 - 2\pi i z x} dx = e^{-\pi z^2} \cdot \int_{\mathbb{R}} \exp(-\pi(x+i z)^2) dx = e^{-\pi z^2} \cdot \int_{\Gamma} e^{-\pi z^2} dz$$

$$\text{change contour!} = e^{-\pi z^2} \int_{\mathbb{R}} e^{-\pi z^2} dz = \boxed{e^{-\pi z^2}} \quad \text{Prop 2.53 or "}\Gamma(1/2) = \sqrt{\pi}\text{"}$$

4

Explicit approximate unit?

Let $\phi(x) = e^{-\pi|x|^2}$. Then $\check{\phi}(\xi) = e^{-\pi|\xi|^2}$.

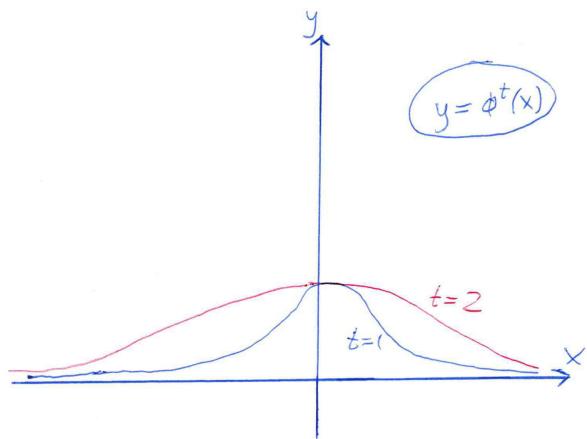

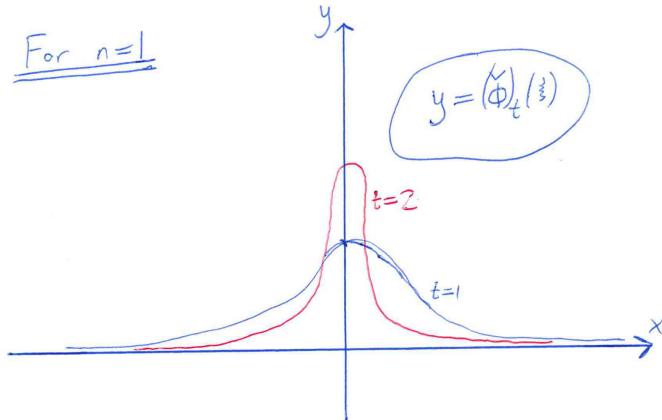

For $t > 0$: $(\check{\phi})_t(\xi) = t^{-n} \check{\phi}(t^{-1}\xi)$ (approx. unit for $*$ as $t \rightarrow 0$)

- We have $(\check{\phi})_t = (\phi^t)^\vee$, where $\phi^t(x) = \phi(tx)$ (true for any $\phi \in L'$)

Note

$$\int_{\mathbb{R}^n} \check{\phi}(\xi) d\xi = 1 \quad \text{and} \quad \phi(0) = 1$$

For $n=1$

5

One alternative: The Poisson kernel

Lemma: If $\phi(\xi) = e^{-2\pi|\xi|}$ then $\check{\phi}(x) = \frac{\Gamma(\frac{n+1}{2})}{\pi^{\frac{n+1}{2}}} (1+|x|^2)^{-\frac{n+1}{2}}$.

Again:

$$\phi, \check{\phi} \in BC \cap L', \quad \int_{\mathbb{R}^n} \check{\phi}(\xi) d\xi = 1, \quad \phi(0) = 1.$$

6

proof of the Fourier Inversion Theorem

Fix some $\phi \in L^1 \cap BC$ with $\check{\phi} \in L^1 \cap BC$, $\int_{\mathbb{R}^n} \check{\phi} = 1$, $\phi(0) = 1$.

Set $\phi^t(x) = \phi(tx)$; then $(\phi^t)^\vee(\xi) = (\check{\phi})_t(\xi) = t^{-n} \check{\phi}(t^{-1}\xi)$.

Apply $f * g = (\hat{f} \cdot g)^\vee$ with $g = \phi^t$.

$$\Rightarrow (\underbrace{f * (\phi^t)^\vee}_\text{Let } t \rightarrow 0)(x) = (\hat{f} \cdot \phi^t)^\vee(x), \quad \forall x \in \mathbb{R}^n, t > 0.$$

\downarrow \hat{f} in L^1 - by the Dominated Convergence Theorem.

The limits must be equal (e.g. by Cor. 2.32), i.e. $f(x) = \hat{f}^\vee(x)$ for a.e. x .

□

7

Fourier Inversion Theorem (8.26):

If $f \in L^1(\mathbb{R}^n)$ and $\hat{f} \in L^1(\mathbb{R}^n)$ then $(\hat{f})^\vee = (\check{f})^\wedge \in C_0(\mathbb{R}^n)$ and $(\check{f})^\wedge = f$ a.e.

$\Rightarrow \mathcal{F}$ (as a map $L^1 \rightarrow BC$) is injective.

The proof of Thm 8.26 shows how to recover f from \hat{f}

even if $\hat{f} \notin L^1$:

For any $f \in L^1$, we have $(\hat{f} \cdot \phi^t)^\vee \xrightarrow{t \rightarrow 0} f$ in L^1 .

See also Thm 8.35.

Application to the heat equation

For $u(x, t)$ ($x \in \mathbb{R}^n$, $t \geq 0$):

$$\begin{cases} \partial_t - \Delta u = 0 \\ u(x, 0) = f(x) \end{cases}$$

$$\Delta_x u = \sum_{j=1}^n \partial_{x_j}^2 u$$

$$\therefore \widehat{\Delta_x u}(\xi) = \sum_{j=1}^n (2\pi i \xi_j)^2 \widehat{u}(\xi) = -4\pi^2 |\xi|^2 \widehat{u}(\xi)$$

$$\text{Thus } \begin{cases} \partial_t + 4\pi^2 |\xi|^2 \widehat{u} = 0 \\ \widehat{u}(\xi, 0) = \widehat{f}(\xi) \end{cases}$$

$$\Rightarrow \widehat{u}(\xi, t) = \widehat{f}(\xi) e^{-4\pi^2 |\xi|^2 t}$$

$$\text{Set } G_t(x) = (4\pi t)^{-\frac{n}{2}} e^{-|x|^2/4t}; \text{ then } \widehat{G}_t(\xi) = e^{-4\pi^2 |\xi|^2 t},$$

9

$$\text{and so } \widehat{u}(\xi, t) = \widehat{f}(\xi) \cdot \widehat{G}_t(\xi) = \widehat{f} * \widehat{G}_t(\xi).$$

$$\text{Hence: } \boxed{u(x, t) = (f * G_t)(x)}$$
